

COMPENDIUM ABOUT THE LINEAR MOTOR TECHNOLOGY

**NIK5.3#5 IN-Kind – Project
Test Package for Linear Motion Technology**

**Author: Michael Klein
Version 1.0 | Date: 24.05.2018**

Document status

Revision	Reason for revision/ Description of amendment	Date
1.0	Initial version	24. May 2018

Content

Structure of the compendium.....	4
History	4
State of the technology.....	4
Construction of linear motors.....	4
Solenoid motor types	4
Short stator and long stator linear motor	4
Modes of action of the linear motor.....	4
Construction and functionality of iron-core linear motors.....	4
Construction and functionality of ironless linear motors.....	4
Linear motors in tubular form	4
Synchronous motor.....	4
Asynchronous motor	4
Reluctance motor.....	4
Comparison linear- and rotative motors.....	4
Classic feed drive system <-> Linear motor	4
Advantages and disadvantages	4
Dimensioning and design of linear motors	4
Motor values and rating	4
Kinematic analysis	4
Attraction – Current – characteristic curve.....	4
Force analysis.....	4
Current – Force – characteristic curve.....	4
Noise behavior.....	4
Worste-case cycle	4
Heat transmission and temperature	4
Frictional forces and frictional losses	4
Winding characteristic	5
Magnetic-based materials.....	5
Cogging torque (pole and furrow)	5
Winding-based parameters	5
Test setups.....	5
Positioning measurements.....	5
Velocity measurements.....	5
Force measurements	5
Influencing variables for the accuracy	5
Control of linear motors	5
Structures of control.....	5
Amplifier sizing.....	5
Safeguarding, thermal motor protection	5
Cooling (Air / Water)	5

Feedback systems / Encoder5

Sources of error.....5

 Mechanical sources of error.....5

 Magnetically sources of error5

 Total error5

General use and application area of linear motors.....5

 Clear view.....5

 Theory and practice5

Application in neutron scattering instruments5

Summary.....5

List of literature.....6

Structure of the compendium

History

State of the technology

Construction of linear motors

Solenoid motor types

Short stator and long stator linear motor

Modes of action of the linear motor

Construction and functionality of iron-core linear motors

Construction and functionality of ironless linear motors

Linear motors in tubular form

Synchronous motor

Asynchronous motor

Reluctance motor

Comparison linear- and rotative motors

Classic feed drive system <-> Linear motor

Advantages and disadvantages

Dimensioning and design of linear motors

Motor values and rating

Kinematic analysis

Attraction – Current – characteristic curve

Force analysis

Current – Force – characteristic curve

Noise behavior

Worste-case cycle

Heat transmission and temperature

Frictional forces and frictional losses

Winding characteristic

Magnetic-based materials

Cogging torque (pole and furrow)

Winding-based parameters

Test setups

Positioning measurements

Velocity measurements

Force measurements

Influencing variables for the accuracy

Control of linear motors

Structures of control

Amplifier sizing

Safeguarding, thermal motor protection

Cooling (Air / Water)

Feedback systems / Encoder

Sources of error

Mechanical sources of error

Magnetically sources of error

Total error

General use and application area of linear motors

Clear view

Theory and practice

Application in neutron scattering instruments

Summary

List of literature
