## 1. SUMMARY

### Operation temperature

Minimum Helium inlet temperature is 10°C.

Maximum Helium inlet temperature is 60°C.

### Shaft operation temperature

Maximum shaft temperature is 200°C. This is defined as an average temperature between the hot outlet and the cold inlet part of the shaft. The shaft will reach this temperature in the case of a trip of the helium cooling system.

### Safety distance

There shall be a minimum distance between Target Wheel and other structures which will be defined on Interface Control Drawings.

### Tolerance drawing

Allocated tolerances have been stated according to ISO 1101 on attached tolerance control drawing ESS-0110316.2

## 2. PRELIMINARY TOLERANCE ALLOCATION- SUMMARIZED. (MM)

| Part            | Dimension  | Base dimension              | Tolerance |
|-----------------|--|-----------------------------|-----------|
| Shaft           | Length   | 7815                        | +/- 1     |
| Shaft           | Angular deviation shaft at shaft top position resulting from shaft misalignment from its bottom surface, misalignment in flange connections, shaft curvature | 7815                        | +/- 1     |
| Pedestal        | Angular deviation at shaft top position resulting from pedestal misalignment   | 7815                        | +/- 0,3   |
| Shaft and wheel | Total horizontal displacement when positioned in bottom of vessel  | 7815                        | +/- 3,6   |
| Shaft and wheel | Relative angular misalignment of shaft when positioned in bottom of monolith   | 7815                        | 0,5 mm/m  |
| Pedestal        | Distance to Target Coordinate System   | 1122                        | +/- 1     |
| Wheel           | Outer diameter including Beam Entrance Window  | 2616                        | +/- 2     |
| Wheel           | Thickness  | 118                         | +/- 0,15  |
| Wheel           | Flatness   | -                           | +/- 0,2   |
| Wheel           | Rib angular position   | 10 degrees between each rib | +/- 1     |
| Wheel           | Misalignment between wheel and shaft   | 2616                        | +/- 0,5   |
| Cassettes       | Distance between ribs and cassettes  | -                           | +/- 0,4   |

Table 1 Tolerances- summary

| <b>9</b>         | Lifting of Wheel and Shaft assembly | Vertical Alignment in level for operation    | +/- 0,1 Vertically      |
| <b>10</b>        | XY- positioning                     | Horizontal Alignment                         | +/- 0,1 Horizontally    |
| <b>11</b>        | Target Wheel pressurized            |  |                         |
| <b>12</b>        | Vacuum in Monolith                  | Vertical Alignment                           | +/- 0,1 Vertically      |

Table 2 Alignment

#### 4. ALLOCATION OF TOLERANCES

Generally, Target Wheel is suspended in a bearing structure which will be aligned, based on the exact position of the Spallation material hotspot in relation to Moderator- reflector structure and Beam Guides.

##### Other conditions

Vertical alignment resolution and accuracy is assumed to be better than 0,1 mm.

## 4.1 Summary Tolerances and results in Vertical direction

### 4.1.1 Geometrical tolerances

| Geometrical tolerances                                     |                |                                    |
|--|----------------|------------------------------------|
| Resulting displacement of wheel disc in vertical direction |                |                                    |
| Tolerance  | Base dimension | Resulting tolerance for wheel disc |
| Shaft length <sup>*1)</sup>                                | 7815           | +/- 1                              |
| Misalignment plane B                                       | 2616           | +/- 0,5                            |
| Misalignment Plane A <sup>*2)</sup>                        | 1200           | +/- 0,25                           |
| Shaft straightness   | 7815           | +/- 0,2                            |
| Parallellity   | 2616           | +/- 0,2                            |
| Thickness  | 118            | +/- 0,15                           |
| Sum  |                | +/- 2,3                            |
| Sum excluding shaft tolerances                             |                | +/- 1,3                            |

Table 3 vertical displacement

\*1) The reason to exclude shaft length tolerances is the alignment procedure, where the shaft is fastened through a clamp to the Drive Unit. The position of the clamp on the shaft, and the lifting of the Target Wheel in correct position is not affected by shaft length tolerances.

\*2) Misalignment after adjustment.

#### 4.1.2 Operational effects

| Operational effects                     | Moderator position | Pedestal position | Reference           |
|---|--------------------|-------------------|---------------------|
| Heating of shaft from 10 to 60 C        | - 3,7              | -3,7              | [1]                 |
| Deformation caused by heating of vessel | -                  | -2,5              | [2]                 |
| Movement caused by Vacuum               | -2                 | -2                | Preliminary numbers |
| Sum before adjustment                   | - 5,7              | -8,2              |                     |

Table 4 Vertical displacement due to operational effects

#### 4.1.3 Distance to lower moderator and pedestal before height adjustment

| Vertical sum  | Pedestal position | Moderator position |
|---|-------------------|--------------------|
| Geometrical 4.1.1                                       | -                 | +/- 1,3            |
| Displacement due to thermal elongation from start 4.1.2 | -8,2              | -5,7               |
| Lowest position   | - 8,2             | -7,0               |

Table 5 Summary vertical displacement

#### 4.1.4 Vertical runout

This deviation is included in 4.1.3 and should be seen as the part of the deviation that is synchronous to the rotation.

| Runout                                 | Moderator position | Pedestal position |
|--|--------------------|-------------------|
| Misalignment plane B                   | +/- 0,5            | -                 |
| Shaft straightness effect, approximate | +/- 0,2            | -                 |
| Sum                                    | +/- 0,7            | -                 |

Table 6 Vertical runout

### 4.2 Accidents- vertical distance

#### 4.2.1 Vertical distance to lower moderator at accident

| Accident        | Initial position tolerance | Geometrical variations 4.1.1 | Thermal elongation from 40 to 200 [1] | Lowest position pedestal | Lowest position moderator |
|-----------------|----------------------------|------------------------------|---------------------------------------|--------------------------|---------------------------|
| Loss of cooling | +/- 0,1                    | +/- 1,3                      | - 15,0                                | -15,0                    | - 16,4                    |
| Bearing failure | +/- 0,1                    | +/- 1,3                      | -                                     | - 15,0                   | - 16,4                    |

Table 7 Vertical movement in accidents

## 4.3 Summary Tolerances and results in Horizontal direction

### 4.3.1 Horizontal alignment procedure- deviations in top position

| Distance   | Base dimension | Allocated tolerances |
|--|----------------|----------------------|
| Displacement Pedestal- Target Coordinate system  | 1122           | +/- 1 mm             |
| Clearance shaft- pedestal after Crane positioning  |                | +/- 1 mm             |
| Angular deviation at shaft top position resulting from pedestal misalignment   | 7815           | +/- 0,3 mm           |
| Angular deviation shaft at shaft top position resulting from shaft misalignment from its bottom surface, misalignment in flange connections, shaft curvature | 7815           | +/- 1,3 mm           |
| Sum of above: Maximum resulting deviation shaft- shielding when shaft is positioned in bottom of monolith  |                | +/- 3,6 mm           |
| Informative: Relative angular misalignment of shaft when positioned in bottom of monolith  | 7,815 m        | 0,5 mm/m             |

Table 8 Horizontal deviation in top position

### 4.3.2 Horizontal- normal operation- geometrical tolerances

|                    |      | Moderator position | Pedestal position |
|--------------------|------|--------------------|-------------------|
| Shaft straightness | 7815 | +/- 1              | +/- 1             |
| BEW Diameter       | 2616 | +/- 2              | -                 |
| Sum                |      | +/- 3              | +/- 1             |

Table 9 Horizontal geometrical tolerances

#### 4.3.3 Horizontal- operational effects

| Operational effects             | Moderator | Pedestal | Reference                                |
|---------------------------------|-----------|----------|--|
| Vacuum                          | +/- 2     | +/- 2    | Preliminary figure                       |
| Misalignment plane (A)          | +/- 1     | +/- 1    | Based on adjustment precision +/- 0,1 mm |
| Sum before adjustment           | +/- 3     | +/- 3    |  |
| Sum after adjustment for vacuum | +/- 1     | +/- 1    |  |

Table 10 Horizontal deviation due to operational effects

Note- adjustment in this case means that the rotor can be adjusted to hang straight as a part of adjustment after vacuum pumping in monolith.

#### 4.3.4 Total horizontal deviation after adjustment

| Horizontal sum                     | Moderator | Pedestal  |
|------------------------------------|-----------|-----------|
| Geometrical 4.3.2                  | +/- 3     | +/- 1     |
| Process after adjustment 4.3.3     | +/- 1     | +/- 1     |
| Most misaligned position           | +/- 4     | +/- 2     |
| Informative: relative misalignment | -         | 0,25 mm/m |

Table 11 Total horizontal deviation

#### 4.3.5 Horizontal runout affecting Beam Footprint \*<sup>1)</sup>

| Runout   | Base dimension | Tolerance |
|--|----------------|-----------|
| Placement of cassettes between shroud ribs     | -              | +/- 0,2   |
| Angular misalignment of shroud ribs            | 1308           | +/- 1     |
| Horizontal runout affecting the beam footprint |                | +/- 1,2   |

Table 12 Horizontal deviation affecting beam footprint

\*<sup>1)</sup> This deviation, summed up with the allowable deviation of speed measurement system, determines horizontal variations of beam footprint on Target.

#### 4.3.6 Accidents/ Failures/ Horizontal

##### Moderator assembly

|                 |   |  |                            |   |
|-----------------|---|--|----------------------------|---|
| Accident        | Initial misalignment at pedestal position 4.3.4 | Initial misalignment at moderator position 4.3.4 | Drop/ distance to Pedestal | Most misaligned horizontal position at moderator position |
| Bearing failure | +/- 2,7   | +/- 4,7  | 7,3                        | <b>12,0</b>   |

## 5. TOLERANCE STANDARDS

1) För basmått under 0,5 mm skall avvikelserna anges vid aktuellt basmått.  
*For nominal sizes below 0,5 mm, the deviations shall be indicated adjacent to the relevant nominal size(s).*

## Straightness and flatness

## 5.2 ISO 13920 Tolerances for welded designs

Linear dimensions

See table 1.

Table 1: Tolerances for linear dimensions

| Tolerance class      | Range of nominal sizes 1 in mm |                   |                    |                     |                      |                      |                      |                       |                        |                        |            |
|----------------------|--------------------------------|-------------------|--------------------|---------------------|----------------------|----------------------|----------------------|-----------------------|------------------------|------------------------|------------|
|                      | 2 to 30                        | Over 30 up to 120 | Over 120 up to 400 | Over 400 up to 1000 | Over 1000 up to 2000 | Over 2000 up to 4000 | Over 4000 up to 8000 | Over 8000 up to 12000 | Over 12000 up to 16000 | Over 16000 up to 20000 | Over 20000 |
| Tolerances $t$ in mm |                                |                   |                    |                     |                      |                      |                      |                       |                        |                        |            |
| A                    | $\pm 1$                        | $\pm 1$           | $\pm 1$            | $\pm 2$             | $\pm 3$              | $\pm 4$              | $\pm 5$              | $\pm 6$               | $\pm 7$                | $\pm 8$                | $\pm 9$    |
| B                    |                                | $\pm 2$           | $\pm 2$            | $\pm 3$             | $\pm 4$              | $\pm 6$              | $\pm 8$              | $\pm 10$              | $\pm 12$               | $\pm 14$               | $\pm 16$   |
| C                    |                                | $\pm 3$           | $\pm 4$            | $\pm 6$             | $\pm 8$              | $\pm 11$             | $\pm 14$             | $\pm 18$              | $\pm 21$               | $\pm 24$               | $\pm 27$   |

**Table 2: Tolerances for angular dimensions**

| Tolerance class   | Range of nominal sizes l in mm<br>(length or shorter leg) |                     |               |
|---|---|---------------------|---------------|
|   | Up to 400   | Over 400 up to 1000 | Over 1000     |
| Tolerances $\Delta\alpha$ (in degrees and minutes)  |   |                     |               |
| A   | $\pm 20'$   | $\pm 15'$           | $\pm 10'$     |
| B   | $\pm 45'$   | $\pm 30'$           | $\pm 20'$     |
| C   | $\pm 1^\circ$   | $\pm 45'$           | $\pm 30'$     |
| D   | $\pm 1^\circ 30'$   | $\pm 1^\circ 15'$   | $\pm 1^\circ$ |
| Calculated and rounded tolerances t, in mm/m <sup>1</sup> )   |   |                     |               |
| A   | $\pm 6$   | $\pm 4,5$           | $\pm 3$       |
| B   | $\pm 13$  | $\pm 9$             | $\pm 6$       |
| C   | $\pm 18$  | $\pm 13$            | $\pm 9$       |
| D   | $\pm 26$  | $\pm 22$            | $\pm 18$      |
| 1) The value indicated in mm/m corresponds to the tangent value of the general tolerance. It is to be multiplied by the length, in m, of the shorter leg. |   |                     |               |
