HighNess

The Neutron – Antineutron Oscillation (NNBAR) Experiment at the ESS

Richard Wagner, ILL

07.10.2022

HighNESS is funded by the European Union Framework Programme for
Research and Innovation Horizon 2020, under grant agreement 951782

Outline

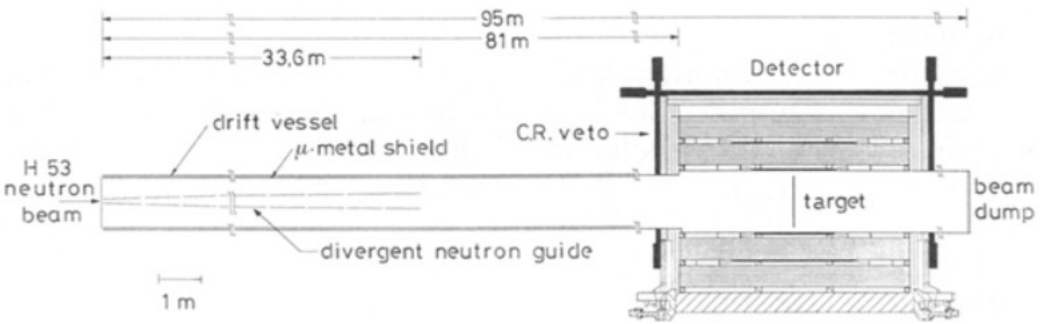
- NNBAR – Motivation
- HighNESS/Moderator
- Optics
- Shielding
  - Magnetics
  - Radiation
- Detector
- Conclusion

Motivation for NNBAR Experiment

- Baryon Number Violation (BNV) may be the key to the observed matter and antimatter asymmetry of baryogenesis
- BNV is a Sakharov condition and needed for theories of baryogenesis
- The process n → n with $|\Delta B| = 2$ is one of the cleanest channels to observe BNV

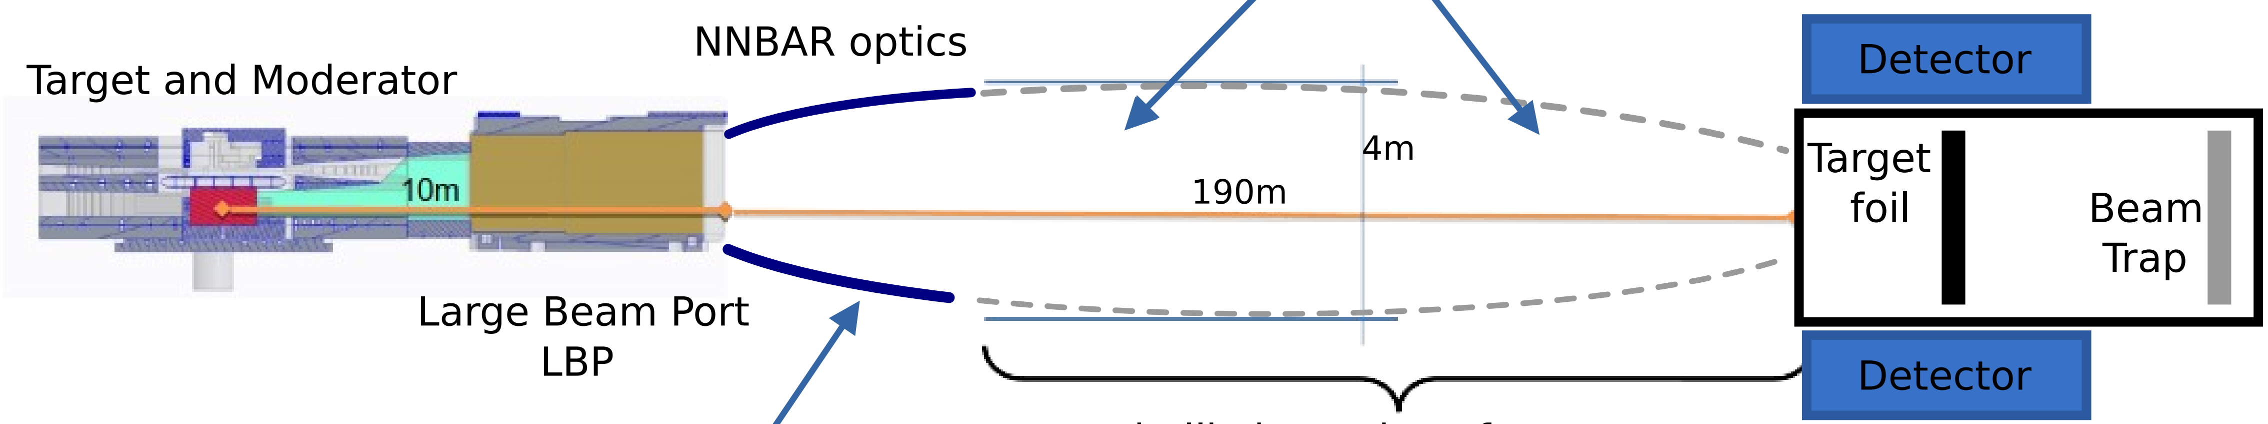
- NNBAR experiment is use case for fundamental physics at the second moderator beam lines at the ESS to
- Fully utilize the high cold neutron intensities of the new LD_2 moderator
- Aim for a 1000 times improved sensitivity at the ESS compared over previous attempts

- Reference Experiment:
  1991 at the ILL
- Holding the current Limit
  for free neutron-anti neutron oscillation time:
  $\tau > 0.86 \times 10^8$ s.
- Unit for figure of merit (FOM): FOM = 1



From Baldo-Ceolin (1994)
DOI:10.1007/BF01580321

Schematics of ESS Experiment (not in scale)



Residual B field <10 nT
Residual vacuum < 10^{-5} P

NNBAR detector area

NNBAR optics

Target and Moderator

Large Beam Port
LBP

ballistic motion of neutrons
free from perturbing
magnetic stray fields, interaction with walls
and ambient gas particles

Reflector Optics
collect large solid angle of emitted neutrons and re-focus to detector area

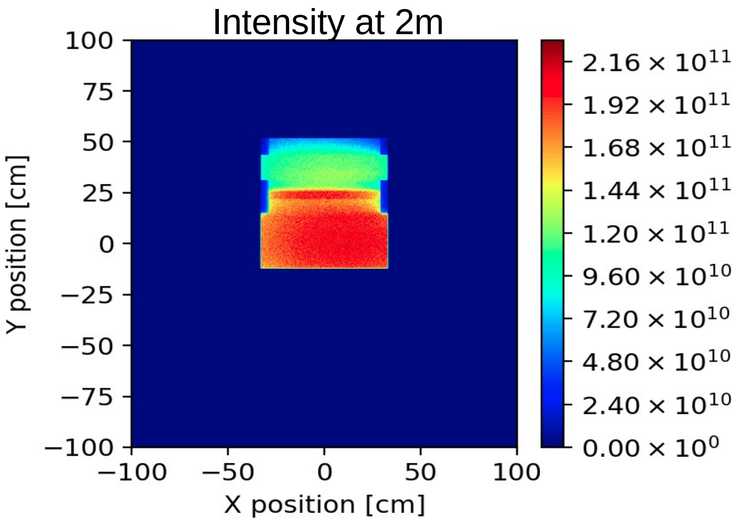
Transition probability
for quasi free condition

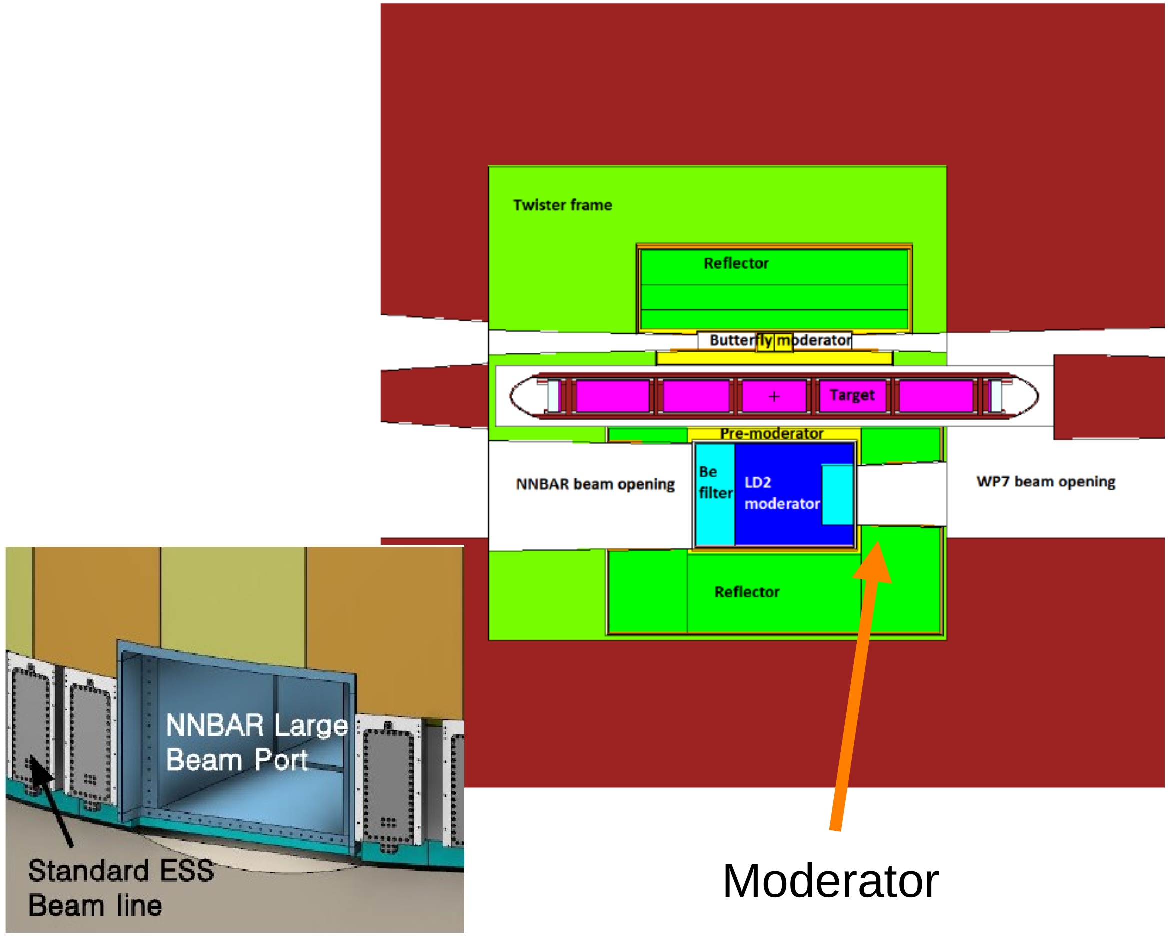
$$P_{n\bar{n}} = \left(\frac{t}{\tau}\right)^2$$

t … uninterrupted flight time
τ … free oscillation time

Moderator and Large Beam Port (LBP)

- Designed in course of the HighNESS-Project
- Optimization criteria:
  Intensity of cold neutrons
  → wavelength range 2-20Å
- Liquid deuterium moderator with Beryllium filter
- Extraction through specially build port that's three times the size of a standard ESS beam line for a beam of highest intensity



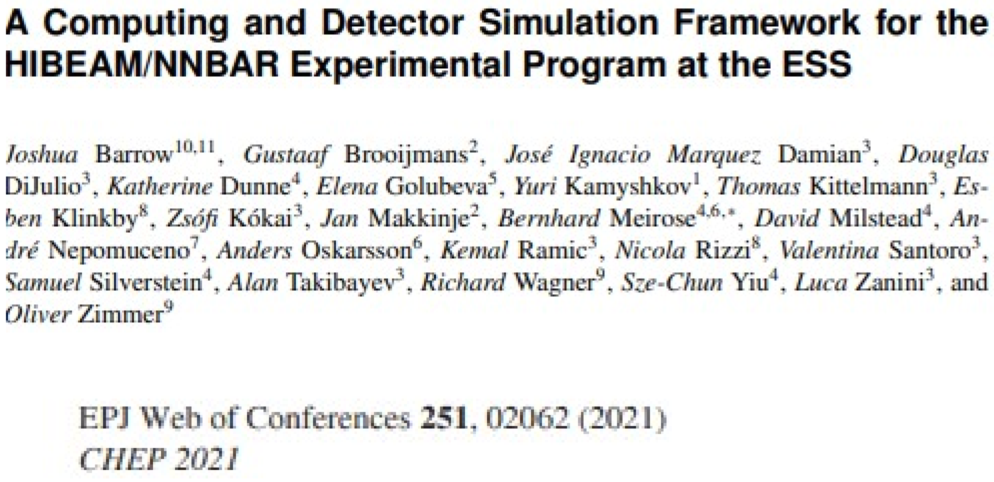


Moderator

HighNess

Monte Carlo Simulation Framework

Software environment set-up to interface predictions of neutron flux and backgrounds with detector simulation with Geant-4. Needed for detector and experiment optimization,



A Computing and Detector Simulation Framework for the HIBEAM/NNBAR Experimental Program at the ESS

MCNP Simulation of the ESS moderator

McStas simulations of the reflector MCNP/PHITS beamline simulation

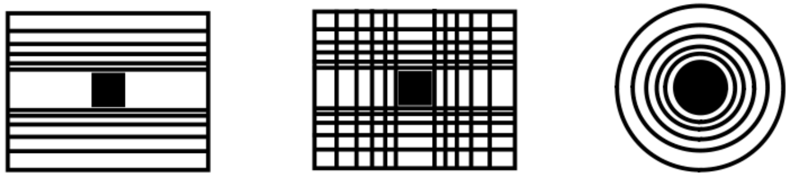
PHITS/MCPL Annihilation target

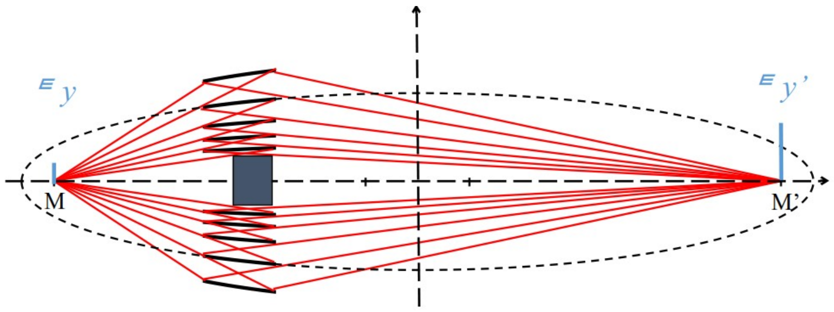
Geant4 Detector Simulations

HighNESS is funded by the European Union Framework Programme for Research and Innovation Horizon 2020, under grant agreement 951782

Optics I

- Design of a nested system of neutron mirrors
- Elliptical mirrors (foci located in moderator and detector) in planar or cylindrical arrangement
- McStas Simulations of performance of a given optical system
- Optical components for simulation are automatically generated
  Python Library





O.Zimmer, arXiv:1611.07353
Journal of Neutron Research 20 (2018) 91-98

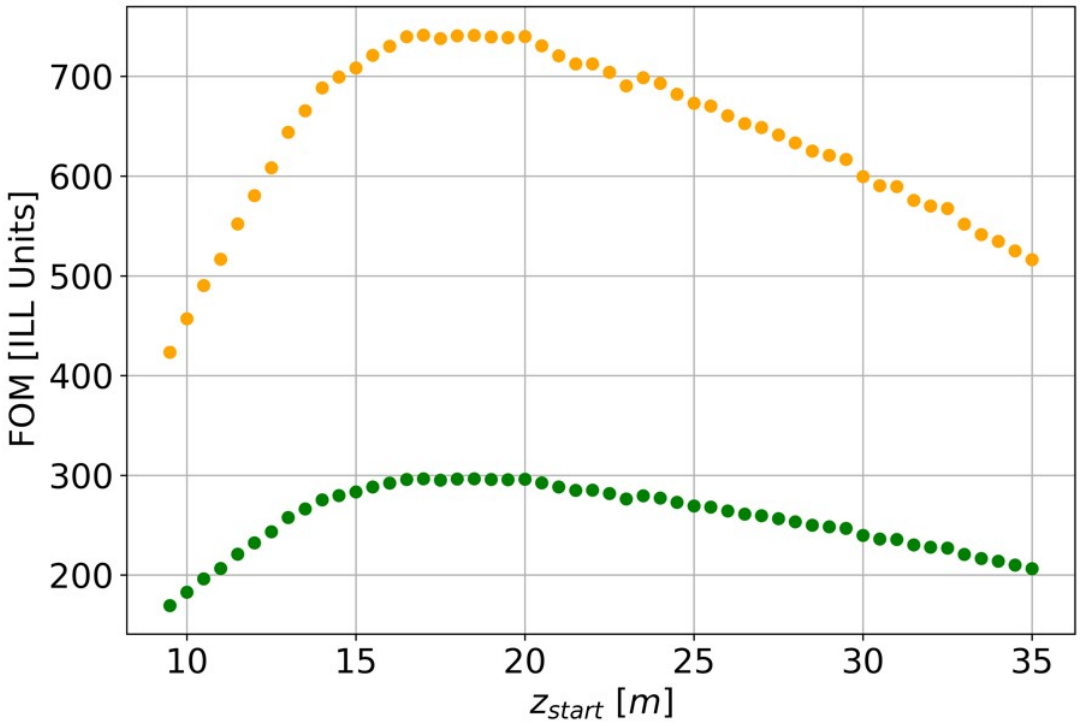
Different optics are compared using the quantity:
FOM Unit is 1991 experiment

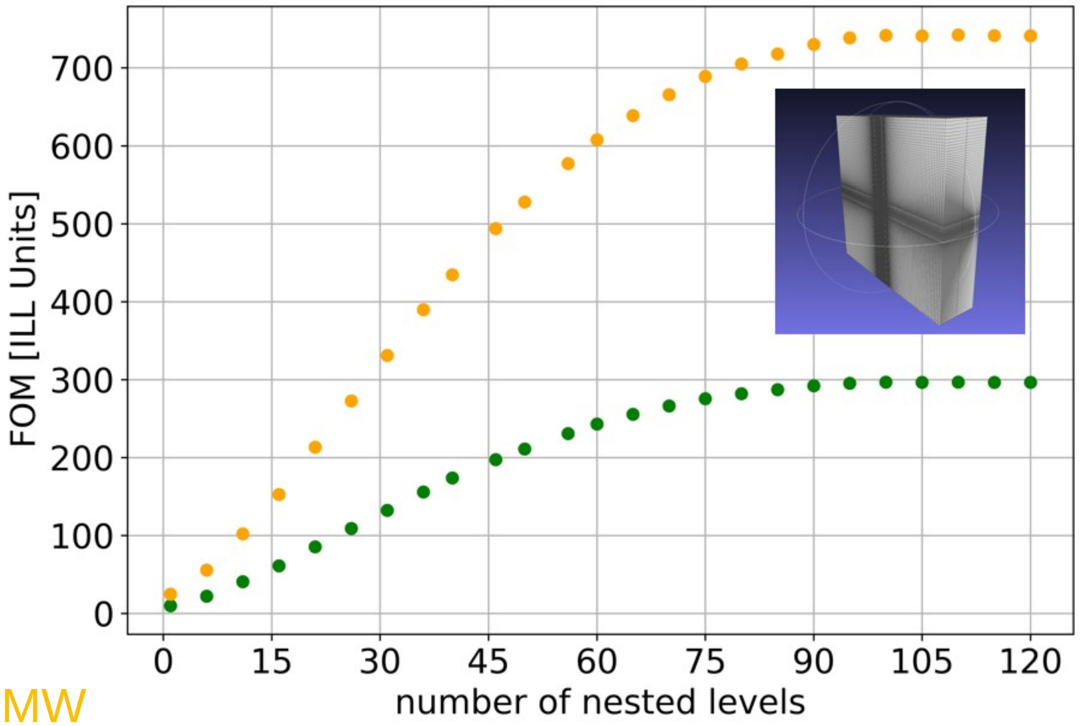
$$FOM = \sum_i \overbrace{N_i}^{\text{neutrons}} * \overbrace{t_i^2}^{\text{(uninterrupted) flight time}}$$

Optics II

Find the optimum optic by varying parameters
(e.g. starting point, # of nested levels, ...)

Example: Simulations for a 1m long nested Reflector





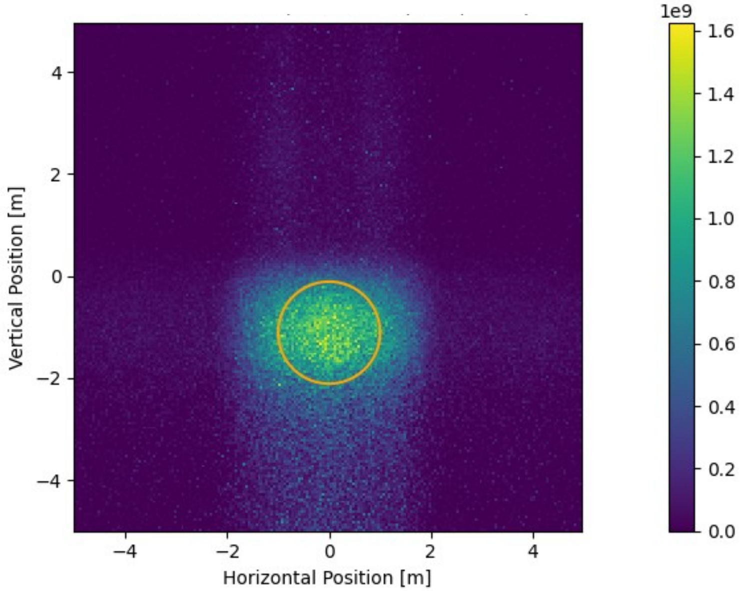
5 MW

2 MW

HighNess

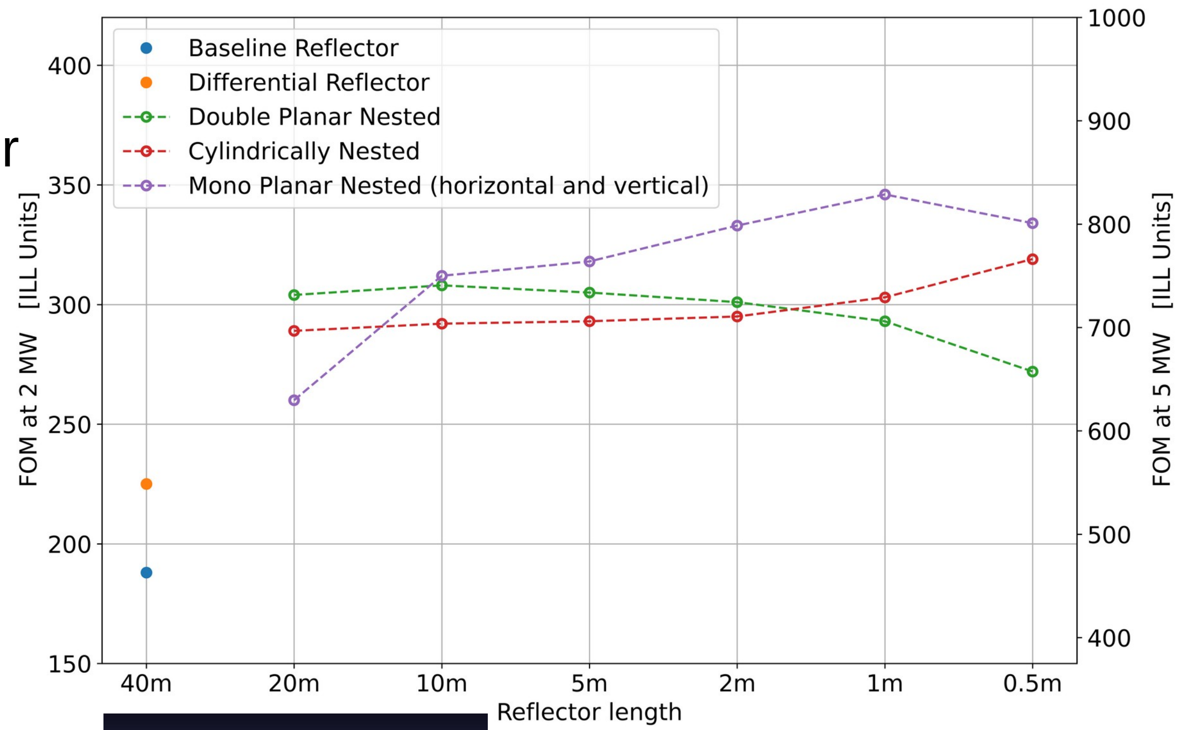
Optics III

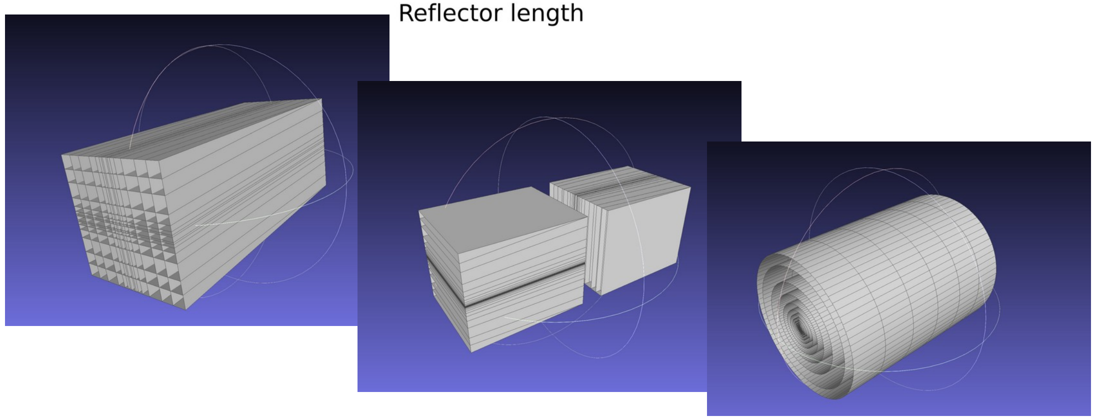
Example: Simulations for a 10m Nested Reflector



FOM: 308 (nested levels=13, 2 MW)

Collected results for different reflector systems

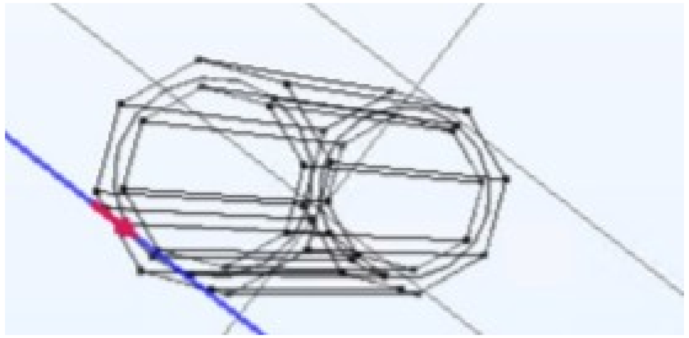


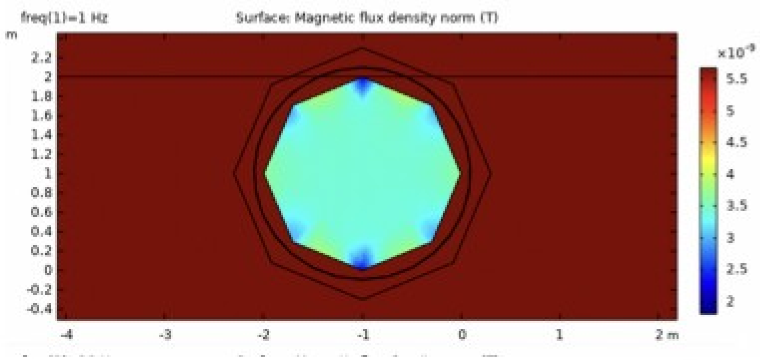


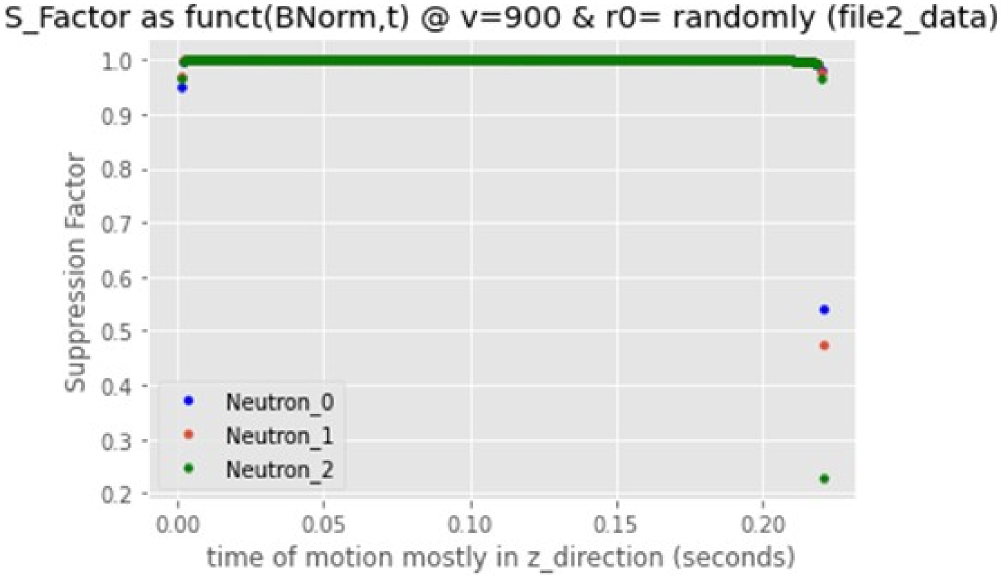
HighNess

Magnetic shielding

- Shield geometry
  - Outer + inner octagon shield from mu-metal
  - Round steel vacuum chamber: between shields
  - COMSOL simulations
- <10 nT
- Monte Carlo study of inefficiency due to finite magnetic field with field map





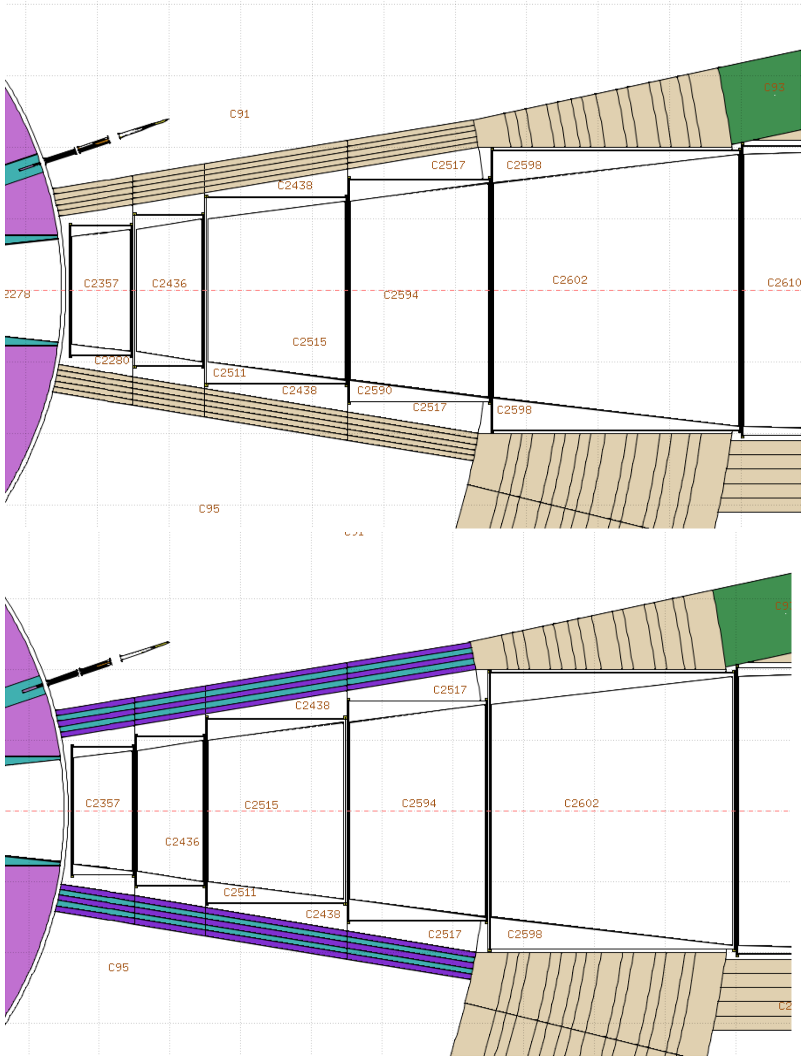


HighNESS is funded by the European Union Framework Programme for Research and Innovation Horizon 2020, under grant agreement 951782

Radiation Shielding (in Bunker)

- Needs to be reduced to ~1 Sv/h
- MCNP 6 calculations
- Beamline model created in CombLayer (https://github.com/SAnsell/CombLayer)
- Two materials investigated:
  - Heavy concrete
  - Layers of regular concrete/steel

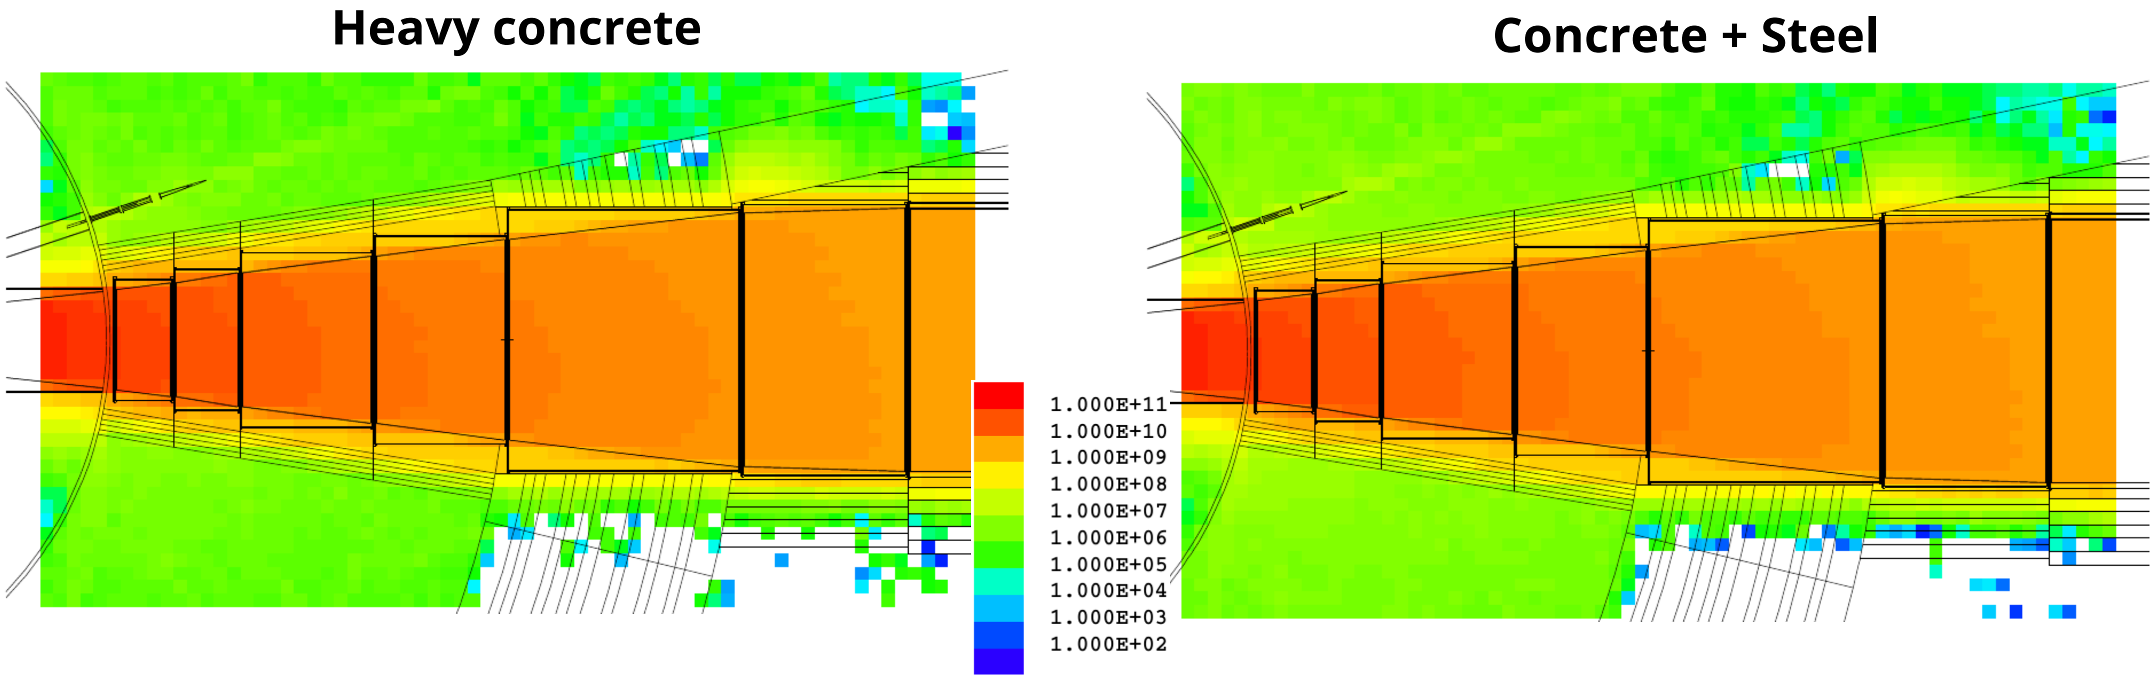
Steel
Concrete
Heavy Concrete



HighNESS is funded by the European Union Framework Programme for Research and Innovation Horizon 2020, under grant agreement 951782

Radiation Shielding (in Bunker)

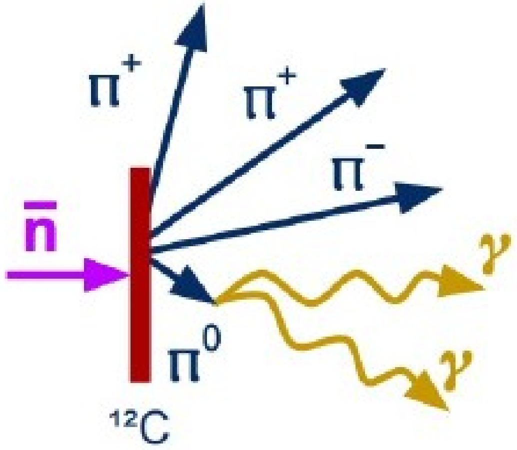
- First results look promising
- Work is ongoing



HighNESS is funded by the European Union Framework Programme for Research and Innovation Horizon 2020, under grant agreement 951782

Detector Design

- Detect a multi-pion final state
- Created due to the annihilation of the anti-neutron in the carbon target foil
- An annihilation generates (on average) 4-5 pions, including a π^0 which decays immediately to 2 γ- rays
- The invariant mass of the final state matches 2 neutron masses: ~1.88 GeV
  - ➔ characteristic signature for a discovery
- Requirements for the Detector
  - Reconstruction of multi-pion final state
  - Invariant mass reconstruction
  - Particle identification
  - Timing sensitivity to reject cosmics and other out-of-time backgrounds



NNBAR Annihilation Detector – Box Geometry

Time Projection Chamber

Filling gas: 80% Ar, 20%CO_2

2 different dimensions (x-y):

0.85 m x 1.87 m

2.04 m x 0.85 m

Both:

2 m	length in z-direction

Scintillator Modules (Calorimeter)

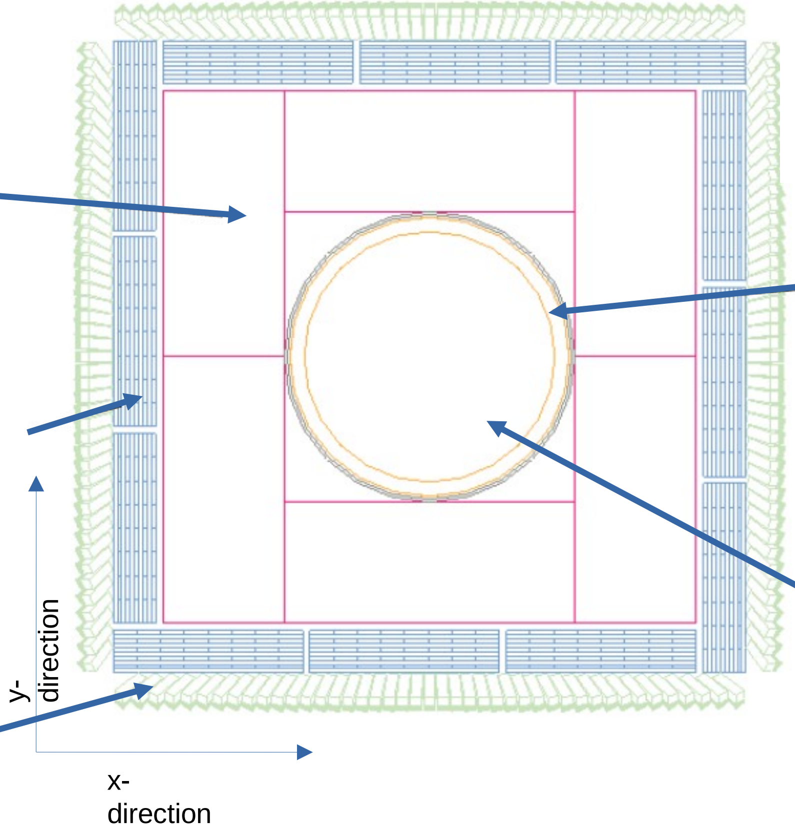
10	layers
3 cm	thickness per layer
8	staves per layer

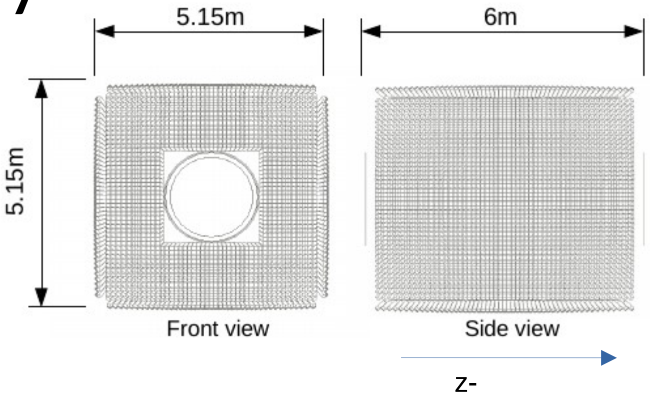
consecutive layers are perpendicular

Lead Glass Blocks

8 x 8 cm	base area
25 cm	height

Oriented towards center of detector





Silicon Trackers

2	layers
6m	length
0.3 cm	thickness

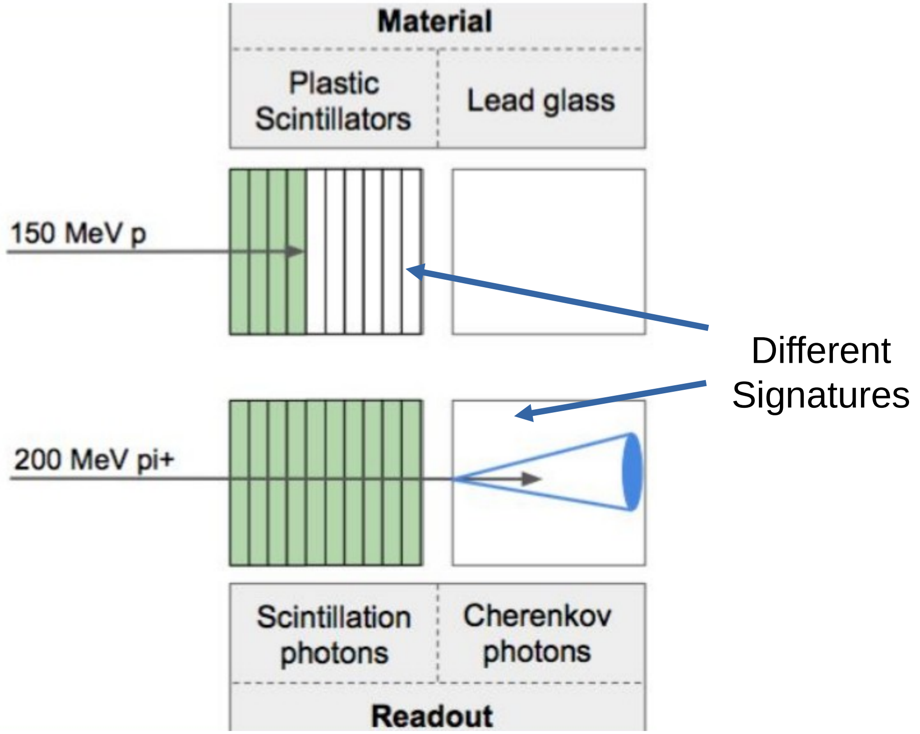
Vacuum tube

1 m	inner radius
2 cm	wall thickness
6 m	tube length

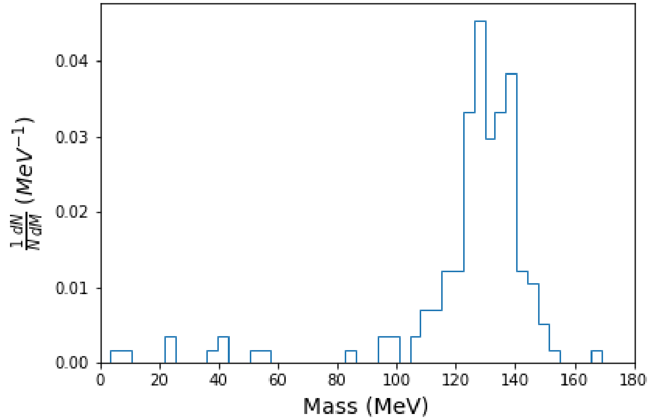
HighNess

Tracker and Calorimeter

- The time projection chambers (TPC) plays an important role in particle identification
- Discriminate pions from protons/muons
- Identification by measurement of the the continuous energy loss dE/dx .
- Components are concealed by an active cosmic muon shield made of scintillators and a passive enclosing overburden



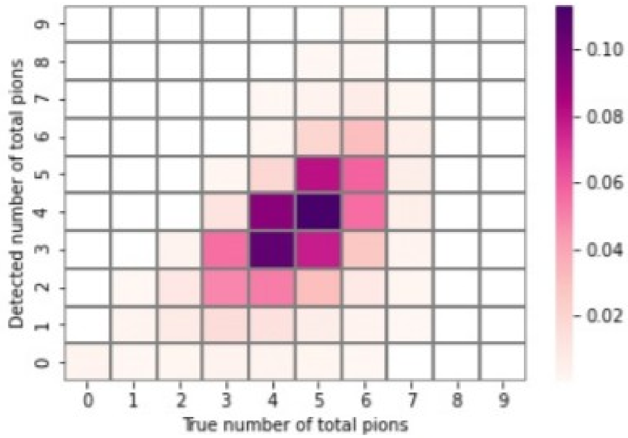
Different Signatures

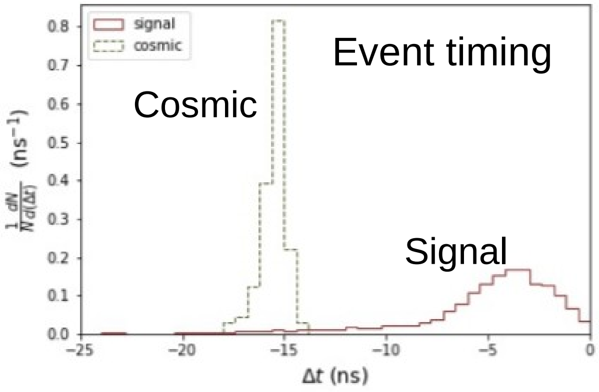


Example: Simulated π^0 mass reconstruction in the calorimeter

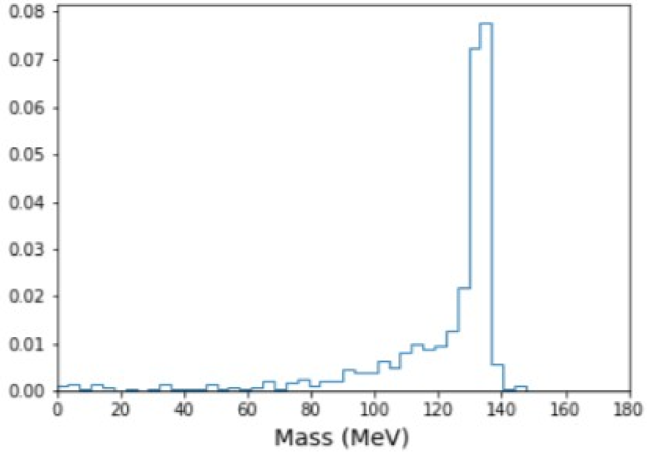
Detector simulation

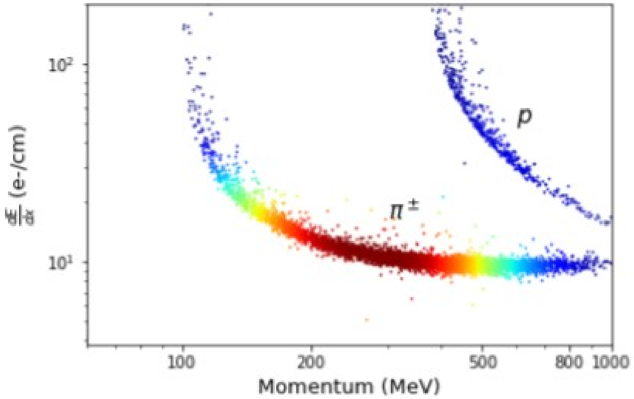
Pion multiplicity

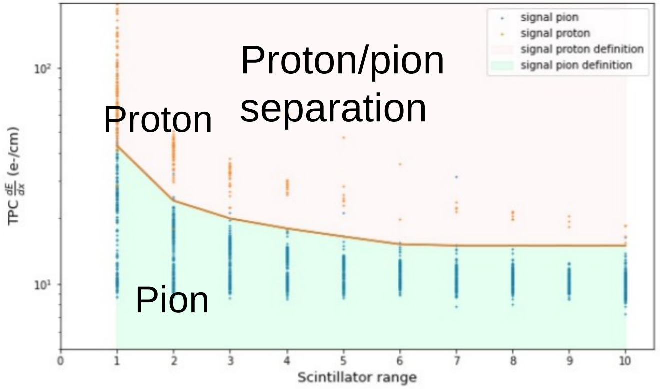


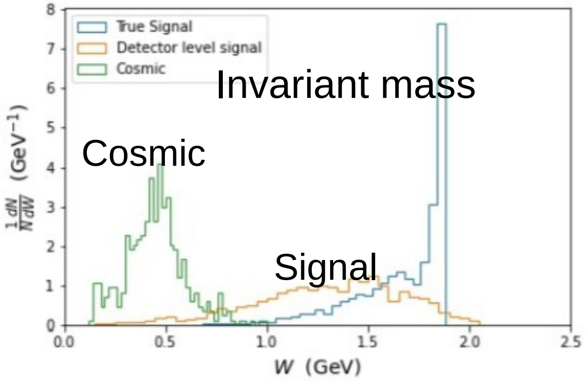


π^0 mass reconstruction









Geant 4 model designed and reproducing well expected distributions

HighNess

The NNBAR collaboration

- Broad international cooperation and support
- ~ 100 researcher from 50 institutes in 8 countries
- Interdisciplinary team that combine experts in neutronics, magnetics, nuclear and particle physics.
- Co-spokespersons: G. Brooijmans (Columbia), D. Milstead (Stockholm Uni.)
- Lead scientist: Y. Kamyshkov (Tennessee Uni.)
- Technical coordinator: V. Santoro (ESS)

Collaborators are welcome !!

White Paper
New high-sensitivity searches for neutrons converting into antineutrons and/or sterile neutrons at the HIBEAM/NNBAR experiment at the European Spallation Source
A Addazi et al 2021 J. Phys. G: Nucl. Part. Phys. 48 070501

Conclusion

- NNBAR experiment will tackle key open questions in modern physics:
  - the origin of matter-antimatter asymmetry and
  - the nature of the mysterious dark matter in the universe
- Contribution in course of the HighNESS project 2020-2023:
  - Design of the optimal moderator for NNBAR
  - Beam line layout
  - Reflector studies for neutron transport
  - Magnetic shielding and background simulations
  - Detector development and design optimization
  - Critical Design review for the full NNBAR experiment

- Prototype development and construction on-going
- Overall goal: Become the flagship experiment for fundamental physics at the ESS with 1000 times improved sensitivity on previous attempts

The Development of the NNBAR Experiment

F. Backman, J. Barrow, Y. Beßler, A. Bianchi, C. Bohm, G. Brooijmans, L. J. Broussard, H. Calen, J. Cederkäll, J. I. M. Damian, E. Dian, D. D. Di Julio, K. Dunne, L. Eklund, M. J. Ferrei
M. Holl, T. Johansson, Y. Kamyshkov, E. Klinkby, R. Kolevatov, A. Kupsc, B. Meirose, D. Milstead, A. Nepomuceno, T. Nilsson, A. Oskarsson, H. Perrey, K. Ramic, B. Rataj, N. Rizzi, V.
Takibayev, R. Wagner, M. Wolke, S.C. Yiu, A. R. Young, L. Zanini, O. Zimmer

The NNBAR experiment for the European Spallation Source will search for free neutrons converting to antineutrons with a sensitivity improvement of three orders of magnitude compared to the last such search. Thi
conceptual design report for NNBAR. The design of a moderator, neutron reflector, beamline, shielding and annihilation detector is reported. The simulations used form part of a model which will be used for optimisa
quantification of its sensitivity.
