1 Introduction.

The target system is where the process of spallation takes place, that is, where the neutrons to be used for scientific research at ESS are generated. In the target wheel, the highly energetic proton beam pulse of the ESS accelerator interacts with the tungsten in the target wheel to generate neutrons, while the energy deposited in the wheel is removed via a system of helium coolant passages. The moderator-reflector systems, oriented above and below the target wheel, slow down (or moderate) the fast neutrons emitted by the target to a speed suitable for the scientific research performed on the ESS instruments.

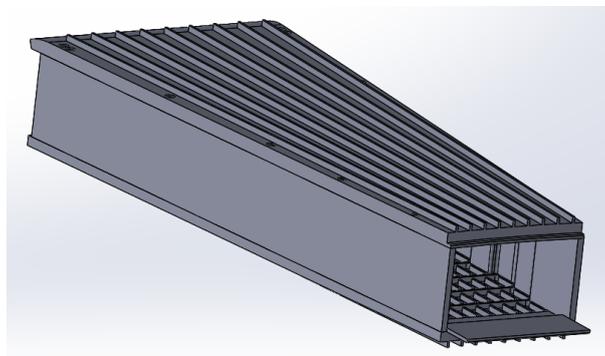

The target wheel will measure 2.5 meters in diameter, it's estimated to weigh 4 tonnes, and it's divided into 36 radial sectors (cassettes). The core of the heart of the target station is the roughly 7,000 tungsten bricks set into the cassettes of the wheel.

Target wheel

36 cassettes

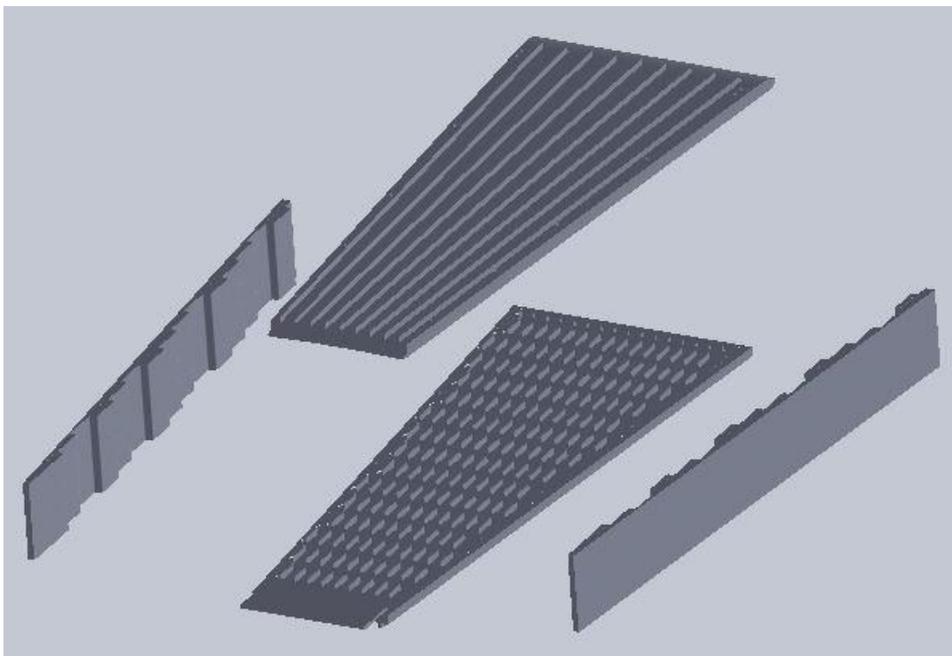

Cut-away top view of target wheel sections, with tungsten brick cassettes shown and 2nd Cassette prototype

Under the project Target Cassette 2nd prototype, LEADING has collaborated and supported ESS-Bilbao target systems team with its expertise in the manufacturing of complex components suggesting some modifications in the initial design to facilitate the machining and the afterwards assembly.

This report describes the design and manufacture of the Cassette 2nd prototype component.

2 Component Lay-out

To manufacture the Cassette 2nd prototype component a detailed design was produced by ESS-Bilbao based on the existing model. As shown below, the final layout of the component matches the original specifications, with some changes to accommodate the practicalities of manufacture suggested by LEADING.

Cassette prototype lay-out

The main differences in the manufactured component, relative to that of the original specification relate to the internal structure, small details to facilitate the assembly of the

parts. The bolt dimensions were reduced to allow the assembly process not will interfere in the original shape of the upper and lower plate. The complete manufacture modification report is attached in the Annex 2.

3 Description of the manufacturing process

The manufacturing route proceeded in two main stages: machining and assembly. The detail of the manufacturing process is described in the following sub-sections.

The final schedule is attached in the Annex 1.

3.1 Raw material

The raw material ordered for the manufacturing of the prototype was stainless steel 316L commercial grade (material certificate 3.1 attached in the Annex 2). The different plates were cut by plasma in square shape 550 x 255 mm; 565 x225 mm; 530 x 70 mm, with 20 mm in thickness.

Raw material SS 316L

3.2 Manufacturing process

The main objective, apart from the milling of the final geometry, was to keep the planarity of the parts due to the small thicknesses of some features, which can compromise the final assembly of the component. Special clamping and tooling were used. The complete manufacturing process of each component is described in detail in Annex 4.

Special clamping in upper plate to avoid bending

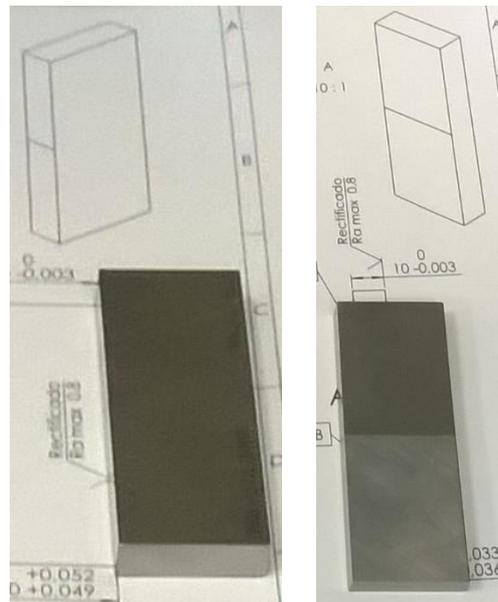

Tooling for upper and lower plate machining

Side wall inside milling machine

Each individual part has been measured and the dimensional reports has been attached in the Annex 5.

In order to check the positioning of the Tungsten bricks, a pass/no pass calibrated tool of 10 and 30 mm has been used. The tolerance of this tool is tighter (H7) than the one accepted in the drawings (H9).

Pass/no pass calibrated tools

3.3 Cleaning and surface preparation

The surface should be free of any surface imperfections larger than 0.5mm in size (unless stated otherwise) with a surface roughness of 1.6 μ m Ra.

To degrease the surface of the stainless steel the item must first be immersed in a solution containing 50% acetone / 50% ethanol (by volume). Cotton wool swabs will be used to rub all the surfaces to ensure that any contamination is removed. If the size of the components is such that immersion is impractical, the item surfaces can be degreased by the use of swabs.

Upper and lower plate after machining

Side walls after machining

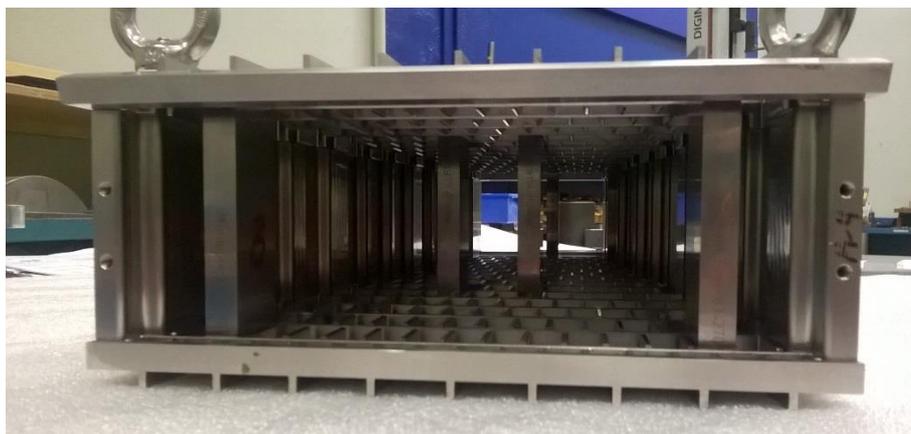

3.4 Assembly

The assembly was successfully performed and did not appear any big problem. However, the overall degree of success will only be evident once the Tungsten bricks assembly has been performed. To verify the assembly process, eight calibrated tool with the Tungsten bricks dimensions were manufactured, each of which was positioned in a random position of the lower plate, the upper plate was fixed with the dowel pins and bolting to the side walls. This process was repeated in other positions, non-interferences were detected.

The complete assembly process is described in detail in Annex 4.

Assembly calibrated tools

The 2nd cassette prototype already assembled and tested with the calibrated tools

3.5 Final measurement

After the assembly and tested the component was measured to check just the main dimensions of the assembly specially the planarity (records attached in the Annex 6). Then, cleaned with ethanol and packed.

The 2nd cassette prototype already assembled

The 2nd cassette prototype already packed and ready for delivery

4 Assessment of the manufacture

Generally the manufacture of the components was very successful. There were no incidents that required the remanufacture of any components. However, some bricks housing in the upper and lower plate were out of tolerance, records attached in Annex 7.

The assembly was successfully performed and did not appear any big problem. However, the overall degree of success will only be evident once all the Tungsten bricks assembly has been performed, which is outside the scope of this manufacture.

Of particular interest are issues that will affect the assembly of future components. In this regard, LEADING wants to propose one main suggestions in order to facilitate the assembly and to improve final results.

- Milling the dattums through the upper plate just after the assembly verification with all the stainless steel assembly tools in the housing of the upper and lower plate, without disassembly the set.

It is very important to define the correct dimension tolerance of the stainless steel assembly tools, must be combined a high precision that simulate all the Tungsten brick dimensions and flexibility that allowed the assembly testing.

PROGRAMA DE MECANIZADO ...

PREPARACIÓN

| NºHTA | CANTIDAD | DESIGNACIÓN | DATOS |
|--------|----------|--------------------|---------------------|
| | 1 | UTILLAJE DE AMARRE | MORDAZA ESPECIAL |
| T1/ N1 | 1 | PORTAFRESAS | 0 mm. (pressetting) |

Colocación de utillaje:

- 1.- Se limpian tanto las superficies de apoyo de la mesa de la máquina como la base del utillaje de amarre.
- 2.- Se coloca el útil sobre la mesa.
- 3.- Se aprietan los tornillos que fijan el útil a la mesa.
- 4.- Se sujeta la pieza a mecanizar con la mordaza, y se procede al planeado del lateral.
- 5.- Se suelta la pieza, se gira y se vuelve a sujetar con la mordaza, para planear el lateral opuesto.

| | | | |

Proceso:

- 1.- Se coloca la pieza en la mesa de control con guías
- 2.- Se comprueban las deformaciones utilizando un reloj comparador.
- 3.- Se endereza la pieza mediante la presión ejercida por las grapas colocada en los puntos deformados.

| T22/ N3 | 1 | PORTAHERRAMIENTAS | 0 mm. (presseting) |

Colocación de utillaje:

- 1.- Se coloca la pieza a mecanizar posicionando con las fijas y se sujeta con tornillos en las orejetas a través del útil. Se procede a realizar el preafinado.
- 2.- Se suelta la pieza y se comprueba la deformación. Si es necesario enderezar, volver a realizar la operación 60 de enderezado.
- 3.- Se coloca la pieza a mecanizar posicionando con las fijas y se sujeta con tornillos en las orejetas a través del útil. Se procede a realizar el afinado.

|--------|----------|--------------------|---------------------|
| | 1 | UTILLAJE DE AMARRE | MORDAZA ESPECIAL |
| T1/ N1 | 1 | PORTAFRESAS | 0 mm. (pressetting) |

Colocación de utillaje:

- 1.- Se limpian tanto las superficies de apoyo de la mesa de la máquina como la base del utillaje de amarre.
- 2.- Se coloca el útil sobre la mesa.
- 3.- Se aprietan los tornillos que fijan el útil a la mesa.
- 4.- Se sujeta la pieza a mecanizar con la mordaza, y se procede al planeado del lateral.
- 5.- Se suelta la pieza, se gira y se vuelve a sujetar con la mordaza, para planear el lateral opuesto.

|------------------------|--------------------------|-----|-------|------------------------------|
| PIEZA | Tapa Cassette ESS Bilbao | | | |
| DESIGNACIÓN | Tapa Cassette ESS Bilbao | OP | 40 | |
| DESCRIPCIÓN | DESBASTE CARA INTERIOR | MAQ | 02-05 | HOJA Nº 1 DE 1 REVISIÓN 0 |
| PROGRAMA DE MECANIZADO | ... | | | |

PREPARACIÓN

| NºHTA | CANTIDAD | DESIGNACIÓN | DATOS |
|---------|----------|--------------------|-----------------------|
| | 1 | UTILLAJE DE AMARRE | ÚTIL ELEVADO ESPECIAL |
| T1/ N1 | 1 | PORTAFRESAS | 0 mm. (presseting) |
| T2/ N2 | 1 | PORTAHERRAMIENTAS | 0 mm. (presseting) |
| T18/ N3 | 1 | PORTAHERRAMIENTAS | 0 mm. (presseting) |
| T19/ N4 | 1 | PORTAHERRAMIENTAS | 0 mm. (presseting) |

Colocación de utillaje:

- 1.- Se limpian tanto las superficies de apoyo de la mesa de la máquina como la base del utillaje de amarre.
- 2.- Se coloca el útil sobre la mesa.
- 3.- Se aprietan los tornillos que fijan el útil a la mesa.
- 4.- Se coloca la pieza a mecanizar posicionando con las fijas y se sujeta con tornillos en las orejetas a través del útil.

| | | | |

Proceso:

- 1.- Se coloca la pieza en la mesa de control con guías
- 2.- Se comprueban las deformaciones utilizando un reloj comparador.
- 3.- Se endereza la pieza mediante la presión ejercida por las grapas colocada en los puntos deformados.

| DESCRIPCIÓN | PLANEADO | MAQ | 02-05 | HOJA Nº 1 DE 1 REVISIÓN 0 |
| PROGRAMA DE MECANIZADO | ... | | | |

PREPARACIÓN

| NºHTA | CANTIDAD | DESIGNACIÓN | DATOS |
|--------|----------|--------------------|---------------------|
| | 1 | UTILLAJE DE AMARRE | MORDAZA ESPECIAL |
| T1/ N1 | 1 | PORTAFRESAS | 0 mm. (pressetting) |

Colocación de utillaje:

- 1.- Se limpian tanto las superficies de apoyo de la mesa de la máquina como la base del utillaje de amarre.
- 2.- Se coloca el útil sobre la mesa.
- 3.- Se aprietan los tornillos que fijan el útil a la mesa.
- 4.- Se sujeta la pieza a mecanizar con la mordaza, y se procede al planeado de la cara.
- 5.- Se suelta la pieza, se gira y se vuelve a sujetar con la mordaza, para planear otra cara, repitiendo esta operación hasta planear las cuatro caras.

PREPARACIÓN

| NºHTA | CANTIDAD | DESIGNACIÓN | DATOS |
|-------|----------|--------------------|------------------|
| | 1 | UTILLAJE DE AMARRE | MORDAZA ESPECIAL |

Proceso:

- 1.- Se coloca la pieza en la mesa de control con guías
- 2.- Se comprueban las deformaciones utilizando un reloj comparador.
- 3.- Se endereza la pieza mediante la presión ejercida por las grapas colocada en los puntos deformados.
